THE CREDIT VALLEY HOSPITAL

Update: All Patient Care Units Open

Tuesday February 25, 2008

FOR IMMEDIATE RELEASE (Mississauga, Ontario): The Credit Valley Hospital officially opened all patient care units to patient admissions and visitors on Monday February 25th following a two-week long outbreak of gastrointestinal illness.

The greatest impact of the outbreak was felt in the already crowded emergency department where patients waited for beds in the hospital to become available. As a result of the outbreak, two surgeries were postponed until a later date. In addition, visitor restrictions were in place on two of the affected units. The hospital's emergency department, clinics and outpatient services continued to operate.

"We are pleased that the infection has been contained as a result of teamwork within the hospital, with partner agencies, the media and the community," says Wayne Fyffe, president and CEO, The Credit Valley Hospital.

The hospital continues to ask the public to prevent the spread of germs at home and within the community by washing their hands frequently. Visitors are asked not to visit patients in the hospital if they are feeling unwell.

The hospital's website www.cvh.on.ca will be updated as new information becomes available. A hand-washing video is available online that shows proper hand-washing techniques.

WHAT IS VIRAL GASTROINTESTINAL ILLNESS (also called “Stomach Flu“)?

Viral gastrointestinal illnesses are passed in the stool and vomit of infected persons.

HOW IS IT SPREAD?

Anyone can get the virus by direct contact with an infected person or by coming in contact with objects contaminated by an infected person. This type of gastrointestinal illness is usually spread by touching infected material and transferring the virus to your mouth.

WHAT ARE THE SYMPTOMS?

Symptoms include nausea, vomiting, abdominal pain, and sometimes fever.

HOW SERIOUS IS IT?

At this time of year, it is normal for healthcare facilities to experience a few isolated staff and patient cases of viral gastroenteritis. While the virus does not cause severe illness, people whose health is already compromised are likely to be more affected. That is why it is very important to prevent the spread of the virus in hospitals.

WHAT IS THE TREATMENT?

This type of illness usually lasts for about two days. Treatment includes plenty of fluids, rest and isolation of patients with symptoms. It is important to know that patients are contagious for 48 hours after their symptoms stop.

HOW CAN I HELP?

The best way to protect yourself from getting sick is by practicing good hand washing and hygiene. If you develop symptoms, please do not visit the hospital until you are better. If you have any concerns about how you are feeling, you should consult your family physician.

People who are ill should try to avoid preparing or handling food for others. Whenever possible, they should also use a separate bathroom.

More information on the various forms of gastrointestinal illness is available by contacting the Region of Peel’s Public Health Department at (905) 799-7700. If community members have any concerns, they should contact their family physician or the local health department.

WHAT IS THE HOSPITAL DOING TO CONTROL THE SPREAD OF THE VIRUS?

We have taken the necessary steps to help avoid spread of the virus, including isolating patients who are experiencing symptoms and treating their symptoms. Our Infection Prevention and Control team is monitoring all areas of the hospital. We have communicated information to families and visitors throughout the hospital asking them not to visit if they are ill.

IF A UNIT IS CLOSED DUE TO AN OUTBREAK, WHEN WILL IT BE RE-OPENED?

The virus is contagious for 48 hours after the symptoms stop. A unit is re-opened when there have been no new cases for a minimum of three consecutive days. We will continue to provide updates on any situation at the hospital.
